NEXT-GENERATION BIOFEEDBACK FOR SAFETY AND PERFORMANCE

Biologically, as “visible parts of the brain”, eyes are ideal for cognitive monitoring

We analyze psychophysiological biofeedback to track changes in e.g., attention and perception

By combining specialized hardware, software and patented neuroscientific algorithms we get to understand how people cope with increasing mental load, internal / external stressors and sudden changes

Maximum Lid Opening

Multi-Parameter Cognitive Analytics

- PERCLOS index
- Gaze direction
- Scanning patterns
- Pupil diameter changes
- Fixations
- Saccades
- Patterns and configurations

Gaze Heatmaps

Blink Analytics

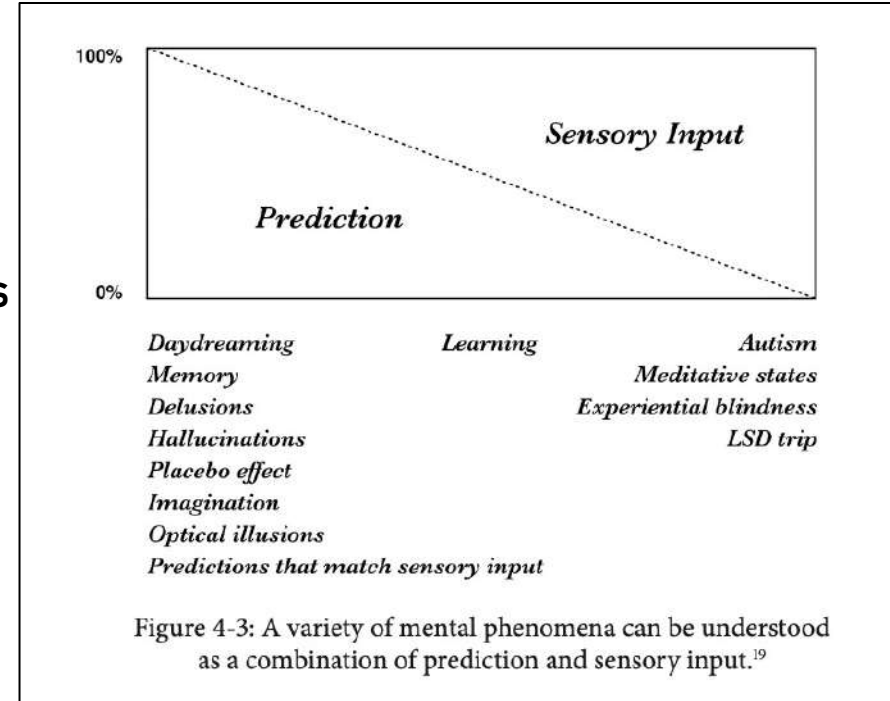

ASSUMPTIONS

non-invasive > invasive
field-proven > laboratory-tested
knowledgeable and firm in theory = understanding the task-at-hand

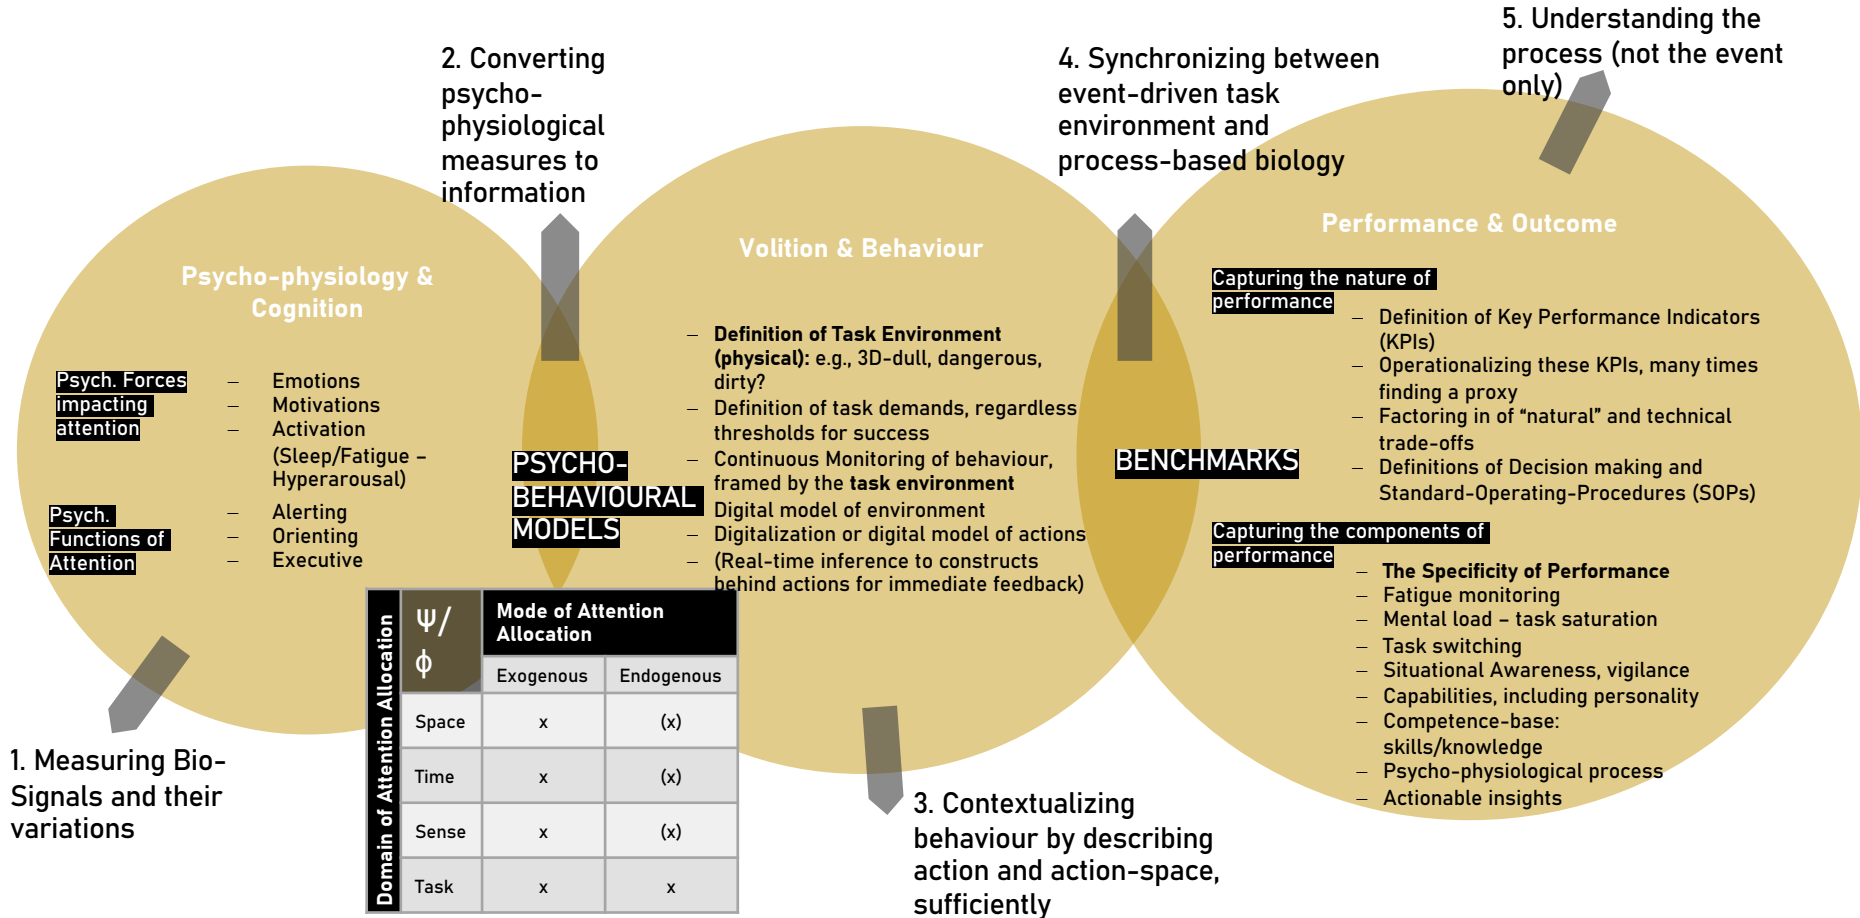

ASSUMPTIONS

- Our brains predict for maintaining the body's energetic system
- *We* are predicting how the “mind” of our trainees works, while it predicts
- (because predicting is what brains do)
- and while it creates/experiences emotions

vgl. Hutchinson, J. B., & Barrett, L. F. (2019). The power of predictions: An emerging paradigm for psychological research. *Current directions in psychological science*, 28(3), 280-291.
Barrett, L. F. (2019). How emotions are made.

**“A genius! For 37 years I’ve
practised fourteen hours a day,
and now they call me a genius!”**

Pablo Sarasate/Spanish violinist and composer

Talent vs. Practice Nature vs. Nurture

Why a “versus” after all when common sense presumes interaction?

RELATIONSHIPS ARE ...COMPLICATED

Features like “Intelligence“
are the INPUT

Key-Performance Indicators
like “Wealth“ are the OUTPUT

THINGS THAT RELATE ARE ...PICKY

Figure 3. Frequency distribution of individual performance
(O'Boyle and Aguinis, 2012)

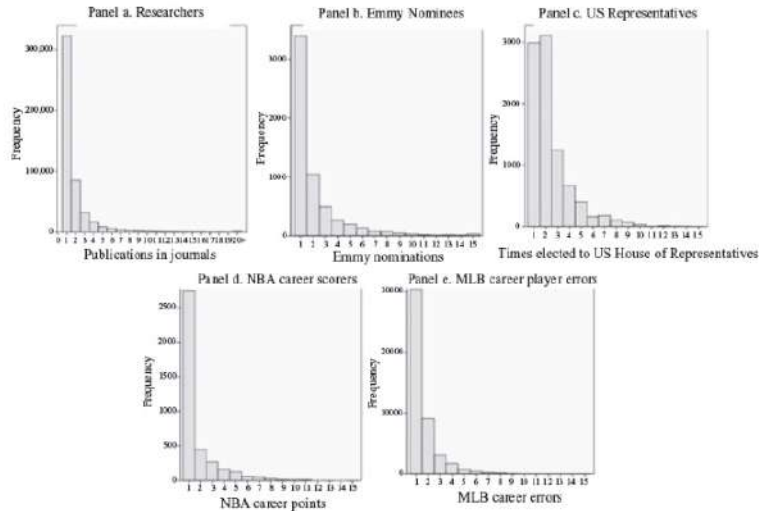

Figure 2: Distribution of Individual Performance for Researchers ($N = 490,185$), Emmy Nominees ($N = 5,826$), United States Representatives ($N = 8,976$), NBA Career Scorers ($N = 3,932$), and Major League Baseball (MLB) Career Errors ($N = 45,885$).

Note. For all Y axes, "Frequency" refers to number of individuals. For clarity, individuals with more than 20 publications (Panel a) and more than 15 Emmy nominations (Panel b) were included in the last bins. For panels c-e, participants were divided into 15 equally spaced bins.

BUFF-CAM for recognition and classification of Eye- and Lidmovements

(2020-2022)

A man imagining his buff self

“Strengthen

In gaming, a buff is an effect that strengthens an in-game character. For example, an ability that increases a character's hit points (HP) or attack power (AP) is a buff.

Typically, players use buffs on themselves and other player characters (PCs). For example, before a boss battle, a player might cast a buff spell that increases their party's attack speed and HP regeneration. In many games, enemies can also use buffs to strengthen themselves or other enemies. Many buff abilities are targeted, meaning they affect only one or more specific characters. However, some are area of effect (AoE) abilities, which affect any character who enters the effect's radius.”

Goal: Develop a method to detect Talents in e-Sport with devices monitoring psycho-physiological processes

Output: Set of methods for racing, SIM racing to detect talents and find ways to train them.

REAL-LIFE REQUIREMENTS FROM SIMULATION

Table 3. Demands of various pressure conditions in esports.

Pressure condition	Demands (examples)
Time	Execution of perception, decision, and action within limited time; fast reactions to visual, acoustic or haptic stimuli; synchronous and sequential actions
Precision	Accurate and precise movements of mouse, hitting the correct keys and buttons
Situation	Variability and complexity of situations in the game
Complexity	Simultaneous and/or sequential coordination of movements; number of hands, fingers, and movements to be coordinated
Stress and strain	Physical and psychic stress/strain regarding muscles (fingers, hand, arm) as well as cognition, perception, motivation, volition, and emotion

<https://doi.org/10.1371/journal.pone.0237584.t003>

<p>Sensori-motor control: Mouse & keyboard Eye-hand/foot coordination Spatial perception Flexibility, strength & endurance Balance Reaction & anticipation Rhythm Motor and sport skills</p>	<p>Personal competencies: Self-observation Self-critics Self-efficacy Identity Self-concept "Big five"</p>
<p>Cognition: Perception & attention Understanding structures and meanings Strategic thinking Problem solving Planning, management Memory & knowledge</p>	<p>Social competencies: Cooperation Interaction & communication Mutual support Empathy Moral and ethical judgements</p>
<p>Emotions, motivation & volition: Emotional control Stress control Causal attribution</p>	<p>Media literacy: Media knowledge Self-regulated use Active communication Setup & customization Maintenance Trouble shooting Media design</p>

Fig 1. Competence model of digital games (according to [9] and [11]).

<https://doi.org/10.1371/journal.pone.0237584.g001>

BUFF-CAM for better Mindset Power and control of peak performance and stamina

Thank you for your attention!

Cases

- Aviation
- Soccer

SOCCER: COGNITIVE PROCESSING INSIGHTS DERIVED FROM EYE ACTIVITY

The object (of danger) is hidden, our goalkeeper invests cognitive capacity, which is reflected in

- Saccades
- Reduced blinking (no time for having eyes closed)
- Fixations on critical points

Eye monitoring results

Same pattern here: the situation requires attention, no blinks, search for cues
